

SFERA: User Manual

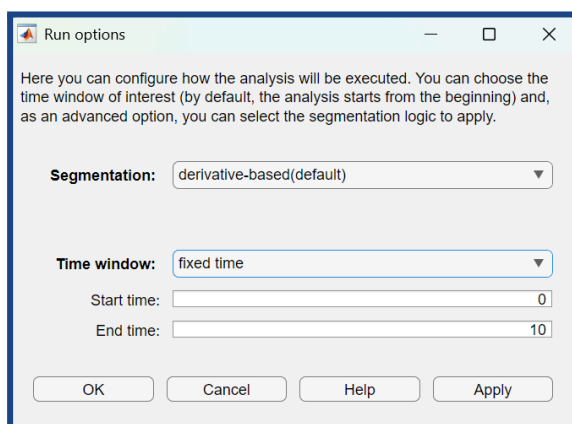

1. Download `SFERA_beta.mlappinstall`.
2. Install the tool (Install App).

3. Open the tool (make sure to place it in a different folder than `SFERA.mlapp` to avoid entry point issues).

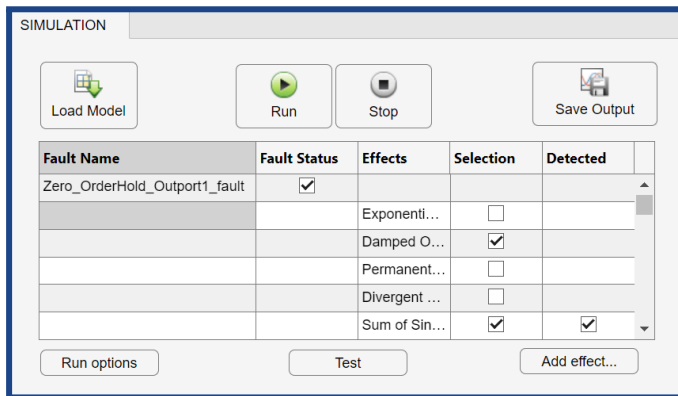

4. Load the model to be analyzed. (**Important:** keep MATLAB open in the folder where the model is located, otherwise it will not be found).
5. Select the run options: segmentation and start/end of the analysis (in *fixed time* mode, the value in the *end* cell automatically updates the end time of execution).

6. Select the faults of interest.

7. Select the effects of interest.
8. Run the analysis.
9. The detected effects will be displayed in the *detected* column at the end of the analysis.

Note:

- The *Add effect* and *Save Output* buttons are not yet implemented.
- The *Test* button was only used for debugging during development. It is not useful for analysis and will be removed in the next release.
